### SIRIO - PT

#### Trigger Pump Inserter

The SIRIO-PT series trigger pump inserter is capable of production speeds up to 350 PPM. The chucks are designed to assure the correct radial alignment of the trigger after torque has been applied. The dip tube is positively guided and controlled throughout the insertion process. Torque is applied by the use of a series of adjustable friction clutch controlled tightening wheels within the SIRIO-PT, no downstream torque system is required.

## SIRIO/P

This series is suitable for the application of:

- dosing pumps
- dispenser pumps
- caps and plugs with dip tubes
- trigger spray pumps
- sprayer pumps and other specialty components

Pump feeding is performed with automatic mechanical rotary distributors with large diameter bowls available for trigger pumps and high speed applications.

Trigger pump orientation is accomplished with a high speed compact linear system conveniently located on the feeder discharge.

Dip tubes are positively guided inside the bottle by a reliable

centering system.

Dip tube orientation option available for most models.

Trigger pump application torque is consistently applied within the capping turret. Torque can be changed while the unit is in operation.
