ROTOTECH Bottle Orientors

DTM
Packaging, LLC

Packaging/Bottling Machinery
and Engineering Services

ROTOTECH

The ROTOTECH series combines unscrambling and orientation into the same machine, allowing for space savings and has been designed for bottles that need to be oriented prior to transfer on to the discharge conveyor.

ROTOTECH

Unscrambling and orienting monoblocs.

This machine arrangement permits any space layout problem to be resolved and is particularly suitable for unstable containers which must be conveyed in pucks. The orientating heads, assembled on a rotary turret, grip the containers for inspection and for orientation. Depending on bottle orientation the heads rotate by 180° before placing the bottles into pucks. Certain bottles, or tottles, with minimal orientating features, may first be placed into pucks and the bottles rotated with the pucks. The empty pucks return to the machine in a closed loop conveying system.
